

Hanko

Claim records for tokenized assets on Solana

Submitted by	duke.sol @dukedotsol
Bounty	Sumiro Studio: Best startup idea that should exist on Solana
Product	https://hankolabs.xyz
Repository	https://github.com/cryptoduke01/hanko
Date	July 17, 2026
Entry	Twitter/X thread + shipped MVP + this document

Every tokenized stock has a price, a chart, a ticker, and a legal structure. Your wallet shows you three. Hanko is the stamp that makes the fourth real.

1. EXECUTIVE SUMMARY

This is proof of work for the Sumiro Studio bounty on Superteam Earn. The brief asks for one sharp Solana startup thesis as a Twitter/X thread (3+ tweets), tagging Superteam, SuperteamEarn, Solana, and SumiroStudio. First prize includes capital, branding, a pitch deck, and an MVP built with Sumiro.

I did not stop at a thread. I researched tokenized equities on Solana, wrote a defensible claim-grading method, and shipped a live product. Judges can open hankolabs.xyz and inspect claim cards with primary-source footnotes, live market data, chart previews, and an explicit grading rubric.

That flips judging from "is this idea good" to "why is this not already funded." The thread is the thesis. The product is the receipt.

Delivered

- Thesis: independent claim records for tokenized assets on Solana
- Thread covering problem, user, Solana fit, why now, MVP, revenue, competitors, GTM
- Live app: Next.js, TypeScript, Tailwind, monochrome Swiss editorial UI
- 25 claim records; 23 with live DexScreener prices and chart previews
- Grading A/B/C/F on /method; product docs on /docs; public GitHub + Vercel

2. BOUNTY REQUIREMENTS MAP

Requirement	Delivery
Idea	Hanko: claim record layer for tokenized equities
Problem	Same ticker, different legal claims; wallets show 3 of 4 fields
User	Retail buyers; wallets/venues; agents trading tokenized equity
Why Solana	Leading tokenized equity volume; speed/fees for continuous checks
Why now	PreStocks void event; Backpack SPCX; Securitize; DTCC; x402 agents
First product	Public labels + index + method; live market enrichment
Business model	Issuer certification; venue data licenses; agent API (x402)
Competitors	RWA dashboards / PoR / ratings: not at Solana trade point
Independence	Venues must not grade their own inventory
MVP	Shipped: hankolabs.xyz (not a promise)
Original angle	Nutrition-label cards; NOT DISCLOSED as signal
Form	Thread + tags per sponsor; Earn submission link

3. RESEARCH PROCESS

I spent time reading structures instead of charts. Core finding: on Solana, multiple tokens print near-identical company charts while representing different legal objects.

Structural classes

- Registered / issuer-sponsored redeemable equity (e.g. Backpack SPCX via ACATS)
- Custodial economic exposure via offshore SPVs (xStocks / Backed; substitute collateral)
- Synthetic / PreStocks-class trackers (underlying issuer may void transfers)
- Unbacked perpetuals: price reference, zero shares held

Timing evidence used in the thesis

- Solana leadership in tokenized equity volume (multi-week / multi-hundred-million days in public coverage)
- May Anthropic PreStocks drawdown; holders learned from charts, not interfaces
- Issuer posture: unauthorized transfers void; third-party tokenized sales may have no value
- Backpack SpaceX, Securitize on Solana, DTCC limited production context
- x402 Foundation: agents will buy faster than they can parse Jersey PDFs
- Public observation (e.g. Jito's Bruder): multiple NVIDIA versions, different charts

Honesty rule: every claim field is linked to a public/primary source or marked NOT DISCLOSED. Invented custody would make Hanko another marketing surface. Absence is the product. Live prices never change a grade.

4. PRODUCT SHIPPED

Hanko answers one question at the point of trade: what does this token legally entitle you to, and who says so? Named for the seal that makes a document real.

Production	https://hankolabs.xyz
Alt deploy	https://hanko-three.vercel.app
GitHub	https://github.com/cryptoduke01/hanko
API	GET /api/market (~30s revalidation)

Routes

Route	Purpose
/	Landing thesis + monochrome seal hero
/assets	Index: search, filters, live price, sparkline, grade
/assets/[ticker]	8-field claim label + market strip + chart embed
/method	A/B/C/F rubric and rules
/docs	Boundaries, API notes, roadmap
/api/market	JSON quotes by slug (DexScreener)

Eight-field claim schema

Issuer · Jurisdiction · Custodian · Authorized by the company · Redeemable into the real share · Voting rights · Dividend treatment · Who may legally hold it. Disclosed values carry source markers; gaps render NOT DISCLOSED with no link.

Grades

Grade	Meaning
A	Registered/issuer-sponsored; redeemable; named custody
B	Economic exposure; collateral may substitute; no vote/direct dividend
C	Material disclosure gaps; incomplete attestation
F	Issuer disputed/voided structure, or no assets held

Coverage at submission

25 claim records. 23 Solana mints with live price, 24h change, volume, liquidity, sparkline, and DexScreener pair chart where a liquid pair exists. Examples: SPCX (A), SECZ structure (A, mint not forced), xStocks set (B), PreStocks class (F), NVDA-PERP unbacked illustration (F).

Stack

- Next.js App Router, TypeScript, Tailwind CSS v4
 - Typed static claims (src/lib/assets.ts); no invent-to-fill backend
 - DexScreener public market feed; 30s client poll
 - Dark/light mode; Vercel production; monochrome editorial system
-

5. THREAD AND VISUAL PACKAGE

Narrative arc is thesis, not listicle:

- Hook: four things exist; wallets show three
- Proof event: Anthropic PreStocks vs issuer posture
- Taxonomy: registered vs economic exposure vs perpetual
- Product: Hanko as claim seal, not price feed
- Label UX: eight lines people will actually read
- Market size + Solana leadership in tokenized equities
- Why now: six-month timeline of real vs fake wrappers
- Agents / x402 will pick cheapest NVDA without reading PDFs
- MVP, distribution, revenue, competitors, venue independence
- Why Sumiro: make unreadable things readable and ship

Four screenshots

- 01 Home (brand optional in caption focus)
- 02 Index: multi-asset table with live prices and sparklines
- 03 Detail: one claim card + market + chart
- 04 Method: grading rubric

Writeups for posts emphasize index, detail, and method; home can appear in the gallery without driving the caption.

6. COMPANY, NOT FEATURE

Objection: why doesn't Jupiter build this? Venues that listed PreStocks cannot be the independent grade of their own inventory. That independence is the firm.

Comparables measure RWA value, verify reserves at issuer request, or rate tokens off the Solana trade surface. None stamp the claim at click-to-buy in wallets and terminals.

Revenue: issuers pay for certification/monitoring; venues license feeds for post-PreStocks liability; agents pay per claim call (x402-ready). The schema that becomes the standard owns the category.

7. AUTHENTICITY

What I did

- Mapped structural classes from public materials
 - Resolved real mints for live enrichment (not mock prices)
 - Wrote claim schema and grades before expanding coverage
 - Shipped production UI with semantic tables and source links
 - Refused to invent fields to look complete
-

- Documented what Hanko is not (terminal, advice, issuer endorsement)

What this is not

- Not financial advice or a buy/sell recommendation
- Not full coverage of all ~150 tokenized assets
- Not fully automated legal reading; claims are curated with live market overlay

8. WHY SUMIRO

Sumiro turns unreadable systems into clear identity and shippable product in short cycles. A claim label is that craft applied to tokenized equity. Solana is winning volume and inheriting unverified claims; someone must write the standard. A studio that shapes identity and ships fast is the right co-builder for brand, deck, methodology, and public build.

v1 already exists in public. Collaboration multiplies distribution into wallets, venues, and Superteam channels, and hardens a standard later versions can attach on-chain via token extensions.

9. LINKS

Product	https://hankolabs.xyz

Author	duke.sol https://x.com/dukedotsol
Host	Superteam Earn Sumiro Studio listing

Closing

The thread argues the idea. The product proves the work. Twenty-five claim records are a wedge; roughly a hundred and fifty wrappers still trade with unread legal structures. Hanko exists so that at the point of trade, the fourth thing is no longer invisible.

Not financial advice. Grades describe legal-structure clarity from public materials, not expected returns.
